Professional Summary

Detail-oriented and proactive Python Developer with hands-on experience building automation scripts, data pipelines, and backend applications using Python, OOP, JSON, and REST APIs. Familiar with web scraping tools including Selenium and BeautifulSoup, and data processing using pandas and CSV/Excel formats. Experienced in writing reusable, modular code and collaborating on end-to-end solutions. Passionate about automating repetitive workflows, cleaning and transforming data, and building reliable pipelines — eager to contribute as an Automation Engineer.

Technical Skills

Core Python: Functions, Data Structures, OOP, Modules, Exception Handling, File I/O
Automation & Scraping: Selenium (Basic), BeautifulSoup (Basic), Script Automation, Task Scheduling
Data Handling: pandas, CSV, JSON, Microsoft Excel, Data Cleaning & Transformation
APIs & Backend: REST APIs, Flask, JSON Parsing & Handling, API Integration
Databases: SQL, SQLite
Dev Tools: Git, GitHub, VS Code, Google Colab, Google Workspace, Eclipse
Other: Debugging, Code Reusability, Problem Solving, Modular Code Design, Agile Basics

Projects

CLI-Based Bank Management System | *Python, OOP, JSON, CSV, File Handling, Git*

- Built a fully automated CLI banking application in Python using OOP, handling account creation, deposits, withdrawals, interest calculation, and balance tracking without any manual intervention.
- Designed reusable and modular `Account` and `Bank` classes — enabling clean separation of logic and easy extensibility, directly reflecting automation pipeline design principles.
- Automated daily withdrawal limit tracking using date-based reset logic, eliminating the need for manual limit management.
- Stored and retrieved structured account data using JSON and file handling, with outputs exportable in CSV/Excel-compatible formats for reporting.
- Implemented robust exception handling and input validation to ensure reliable, error-free automated execution.
- Maintained full version history using Git with structured commits for traceability and code review readiness.

IoT-Based Smart Parking Management System | *Python, ESP32, RFID, REST API, Blynk Cloud*

- Developed Python-based automation logic for real-time vehicle detection, slot allocation, and automated gate control — replacing manual parking management entirely.
- Integrated hardware sensor data (IR, RFID) with Blynk cloud via REST API calls, building an end-to-end automated data collection and monitoring pipeline.
- Parsed and processed real-time JSON data from cloud API responses to drive automated decision-making for slot availability updates.
- Iteratively debugged and improved automation scripts to ensure stable, accurate, and reliable system performance across all edge cases.

Education

Bachelor of Engineering in Electronics and Communication Engineering — **Sep 2021 – June 2025**
Panimalar Engineering College(Affiliated to Anna University; Approved by AICTE)(CGPA: 8.35/10) — *Chennai, Tamil Nadu*

Board of Intermediate Education(Class XII) — **June 2019 – July 2021**
Shri Veda Junior College (83.1%) — *Tirupati, Andhra Pradesh*

Board of Secondary Education(Class X) — **June 2018 – May 2019**
Vedavyasa Vidya Niketan (CGPA: 9.8/10) — *Tirupati, Andhra Pradesh*

Certifications

Complete Python Pro Bootcamp — **April 2025**
Python automation, OOP, data handling, file I/O, and hands-on scripting projects – Udemy — *Online*

Agentic AI and Generative AI (Currently Learning) — **2026**
AI-powered automation workflows, LLM integration, and agentic pipeline development — *Online*

Java Programming — **July 2024**
Core programming logic and structured thinking – QSpiders, Chennai — *Chennai*
